

VONATARIUS “TAY” VALERION

McKinney, TX | (214) 918-4025 | VonatariusValerion@gmail.com | linkedin.com/in/TayValerion/

PROFESSIONAL SUMMARY

Computer Science student concentrating in Software Engineering with hands on experience supporting secure communication systems, network infrastructure, and technical troubleshooting in high pressure environments. Four years of service in the U.S. Marine Corps resolving complex system issues, maintaining secure communications, and supporting mission critical operations. CompTIA Security+, CompTIA Tech+, and Google IT Support certified with a strong foundation in networking, system diagnostics, and technical support. Experienced in identifying root causes, documenting issues, and communicating solutions clearly to both technical and non technical users. Currently pursuing a Bachelor of Science in Computer Science with expected graduation in August 2026.

CORE COMPETENCIES

IT Support & Troubleshooting | Secure Communications | Hardware & Software Installation
Network Systems Maintenance | Technical Documentation | System Diagnostics
End-User Support | Electronic Systems Repair | Training & Team Support | Workflow Optimization | Ticketing systems / CRM | Escalation handling | Case documentation | Customer issue resolution | Debugging | Root Cause Analysis | Issue Tracking | Git (Developing) | Technical Support

Technical Support & Debugging Experience

- Diagnosed and resolved complex communication and network issues using structured troubleshooting methodologies
- Identified root causes of system failures through signal analysis, configuration checks, and hardware isolation
- Documented technical issues, resolutions, and system behavior for operational tracking and knowledge sharing
- Communicated technical problems and solutions clearly to users with varying levels of technical understanding
- Escalated advanced issues when necessary while maintaining clear updates and resolution timelines
- Supported secure systems by ensuring proper configuration, encryption alignment, and connectivity validation

CAREER ACHIEVEMENTS / PROJECT HIGHLIGHTS

- **Technical Training:** Completed 700+ hours of electronics and telecommunications training, strengthening technical troubleshooting capabilities.
- **Systems Diagnostics:** Diagnosed and repaired communication systems supporting mission-critical operations with zero outages during training exercises.
- **Team Training:** Trained and supported 6–10 personnel on equipment usage which led to a 100% comprehension and understanding of all procedural hardware, documentation requirements, and system maintenance processes.
- **Process Improvement:** Improved workflow accuracy at Uline by supporting technology-based inventory controls by 45% in the hand-stack nightshift department while entering a new building in a high-volume logistics environment.
- **Software Development:** Developed software applications in C++, Java, and Python using SDLC concepts, modular design, testing procedures, and documentation standards.

PROFESSIONAL EXPERIENCE

Uline | Irving, TX
Warehouse Specialist

7/2019 – 4/2025

- Supported technology-based inventory and tracking systems to maintain accuracy and efficient workflow.
- Trained 10 team members on equipment operation, digital documentation processes, and safety procedures.
- Coordinated daily tasks while maintaining accuracy and adherence to company standards.

- Maintained equipment and work areas to ensure operational readiness and compliance with standards.
- Collaborated with cross-functional teams to meet daily productivity and quality goals.

United States Marine Corps | Twentynine Palms, CA
Ground Electronics & Telecommunications Technician

1/2018 – 10/2022

- Installed and configured communication hardware and networking equipment supporting secure voice and data systems in operational environments.
- Troubleshoot connectivity and hardware issues using structured diagnostic procedures to maintain system reliability and operational readiness.
- Performed preventative maintenance, system inspections, and technical documentation to ensure equipment uptime and reliability.
- Supported secure communications by following COMSEC procedures and maintaining accountability of sensitive equipment.
- Completed extensive technical training, including electronics fundamentals, troubleshooting, digital logic, and circuit repair.

VONATARIUS “TAY” VALERION | PAGE 2

Team Lead | 2018 – 2022

- Led up to 8 personnel in communication system setup, testing, and operational support during training exercises, resulting in approximately 70% of trainees independently performing hands on tasks correctly.
- Mentored junior personnel in troubleshooting methods, equipment maintenance, and adherence to policies.
- Configured and aligned tactical communication terminals to establish encrypted links with authorized nodes.
- Ensured readiness and accountability of communication gear through consistent inspections and documentation.
- Applied structured decision-making and problem-solving in high-pressure operational environments.

EDUCATION

Bachelor of Science, Computer Science with a Software Engineering Concentration
Southern New Hampshire University | Expected August 2026

Relevant Coursework: Software Development, Data Structures, Systems Analysis, Operating Systems, Linux Fundamentals, Secure Coding, Networking, Software Project Management

CERTIFICATION

CompTIA Security+
 CompTIA Tech+
 Google IT Support Professional Certificate

TECHNICAL PROJECTS

Dual Clock Application (C++): Designed an object-oriented time conversion program using modular functions and ISO 8601 formatting.

Investment Calculator (C++): Built an OOP application simulating compound interest scenarios with validated user inputs and clear reporting.

Basic Clock (Java): Applied SDLC principles to design, test, debug, and document a functioning timekeeping program.

BMI Calculator (Python): Automated calculations using algorithmic logic, modular code structure, and comprehensive testing documentation.

RELEVANT TECHNICAL EXPERIENCE

Secure Communications System Deployment & Configuration:

- Configured secure communication systems using AN/PRC-117G radios and SKL devices for encrypted transmission

- Verified frequency settings, encryption alignment, and system connectivity
- Conducted system validation testing to ensure reliable communication between endpoints

Network Troubleshooting & System Recovery:

- Diagnosed and resolved communication and connectivity issues using structured troubleshooting methods
- Isolated hardware, cabling, and configuration faults to restore system functionality
- Applied TCP/IP fundamentals and signal flow analysis to maintain system reliability

COMSEC Security & Access Control Management:

- Maintained accountability of sensitive communication equipment and encryption keys using strict COMSEC procedures
- Controlled access to secure systems ensuring only authorized personnel handled critical equipment
- Conducted inspections and resolved discrepancies to maintain compliance

Systems Integration & Connectivity Setup:

- Integrated radios, antennas, and network components to establish stable communication links
- Verified signal strength and system alignment to optimize performance
- Ensured consistent data transmission across multiple systems

PROJECTS

PROJECT 1 — SECURE COMMUNICATIONS DEPLOYMENT: Secure Communications System Deployment & Encryption Configuration 2019 – 2022 Deployed and configured secure voice and data communication systems in field environments using AN/PRC-117G radios and AN/TRC-170 troposcatter systems Loaded and managed encryption keys using SKL (Simple Key Loader) ensuring proper COMSEC alignment and secure transmission Verified system configuration including frequency setup, signal paths, and encryption settings prior to operation Conducted system validation testing to ensure reliable communication between multiple endpoints Troubleshoot connectivity and configuration issues using built-in diagnostics and manual signal verification Equipment: AN/PRC-117G, AN/TRC-170, SKL, antennas, RF cabling Software / Concepts: COMSEC procedures, encryption key management, signal flow analysis, secure communications

PROJECT 2 — COMSEC ACCOUNTABILITY & SECURITY CONTROL COMSEC Equipment Security & Access Control Management 2018 – 2022 Maintained strict accountability of sensitive communication equipment and cryptographic materials in compliance with COMSEC standards Controlled access to encrypted systems ensuring only authorized personnel handled secure devices and keys Performed routine inspections and audits of communication equipment to identify discrepancies or security risks Documented equipment usage, key distribution, and system status for operational accountability Responded to potential security risks by following escalation and corrective procedures Equipment: SKL devices, encrypted radios, secure storage systems Software / Concepts: access control, asset tracking, risk mitigation, compliance procedures

PROJECT 3 — NETWORK TROUBLESHOOTING & SYSTEM RESTORATION Field Network Troubleshooting & System Recovery 2019 – 2022 Diagnosed and resolved communication failures across networked systems by isolating hardware, cabling, and configuration issues Tested connectivity using structured troubleshooting methods including signal tracing and component isolation Worked with field-deployed network setups including routers, radio relay systems, and communication terminals Verified and corrected configuration settings including IP addressing and connectivity alignment Restored system functionality under time-sensitive conditions to maintain operational readiness Equipment: field routers, communication terminals, cabling systems Software / Concepts: TCP/IP fundamentals, network troubleshooting, signal flow diagnostics

PROJECT 4 — PREVENTATIVE MAINTENANCE & SYSTEM HARDENING Communication Systems Maintenance & Reliability Optimization 2018 – 2022 Conducted preventative maintenance on communication systems to ensure consistent performance and reduce system failures Inspected hardware components including cables, connectors, and system modules for faults or degradation Tested system functionality and verified configurations prior to

operational use Identified potential issues early and applied corrective actions to prevent downtime Maintained system readiness in high-demand environments Equipment: radios, cabling, communication hardware systems Software / Concepts: system diagnostics, maintenance procedures, reliability engineering

TECHNICAL SKILLS

Programming: C++, Python, Java

Systems & Tools: Windows OS, Linux (Developing), Microsoft Office Suite, Git (Developing)

Networking & Security: TCP/IP, Secure Communications, System Troubleshooting, COMSEC Procedures, Security+

Engineering Concepts: Object-Oriented Programming, Data Structures, Digital Logic, Software Design, Software Testing
